

9ThirtyOne

The cadet and instructor feedback cycle,
owned entirely by your detachment.

An introduction — what it is, what it does, and how it is used

A feedback app that stores nothing on anyone else's computer

Cadets answer a short form on their phone. Instructors see the results analysed, not just listed. Every record is written to a Google Drive folder your detachment already owns.

Your Google account

No vendor holds your data, because no vendor is involved. If you stop using the app, every response is still sitting in your Drive.

Any device

Runs in a browser and installs to a phone home screen. Works with no signal and sends when the connection returns.

Nothing to buy

No licences, no subscription, no server to maintain. Setup is a Drive folder and about 45 minutes, once.

A detachment cannot run on a university's system

Which is the whole reason none of the ordinary tooling fits.

AFROTC is a centralized detachment model.

One host facility, cadets from several Crosstown universities.

So no one university's IT system can serve the detachment.

It has cadets at schools that system has never heard of.

So the detachment stands up a Det Google Account.

Which solves communications, and loses everything else.

What that costs

No feedback system standardized across detachments.

Aerospace Studies runs through host university systems, with varying degrees of return.

Leadership Laboratory has no capture at all.

Upperclassmen improvise on personal accounts — no oversight, no archive, gone at graduation.

Cadets are required to instruct. Nothing certifies them to.

The second gap, and the one feedback actually closes.

AFROTC requires upperclassmen to instruct lowerclassmen.

It provides no formal certification process for doing it.

No baseline, no structured feedback on their teaching, no record of improvement across a term.

Cadre are accountable for the outcome, working without instruments.

Where feedback stops being admin

A cadet instructor who can see how a block landed — and see it again next term, measured the same way — is being developed.

One who cannot is being assigned.

Paired with the Teaching on Purpose seminar, that turns feedback into a path to certification rather than a survey.

Your folder is the database

Each record is a plain file you can open in Drive — nothing is locked in a format only this app can read.

```
9ThirtyOne/  
  config/      detachment profile and settings  
  users/       the roster: who may sign in, and as what  
  forms/       feedback form definitions  
  requests/    feedback issued, each with an ID  
  responses/    submitted feedback  
  receipts/    who submitted, kept apart from  
               what they said  
  reports/     exported reports
```

Stop using the app and you still have every response.

Readable in Drive, backed up by Google, recoverable from the trash for 30 days.

Who can read the feedback is a Drive sharing setting.

Not a setting inside this app. That is the access control that actually matters.

Built around the chain of command

Cadet

Sees only what is assigned to them. Submits once.

Instructor

Creates feedback, reads responses, runs the analysis.

Cadre

All of that, plus a space instructors cannot see.

Commander

Sees every space, including one only they can read.

Database admin

Keeps the roster. A separate job, often held alongside.

Only what is assigned to you

Filtered by school year, semester, class and due date. Anything already submitted drops off the list.

Cadets choose a word. The maths runs on the number.

The screenshot shows the 9ThirtyOne app interface for a feedback form titled "AS200 Leadership Lab — Drill Block 3". The form includes instructions, a note about anonymous responses, and three rating sections. Each rating section has a title followed by nine buttons representing different ratings: Detrimental, Alarming, Unfavorable, Minor, Neutral, Slight, Favorable, Major, and Outstanding. The first rating section is for "Instruction was clear and well paced", the second for "The event was well organised", and the third for "I can apply what I learned". Below these is a text input field for "What should change next time?" with a word count of 0 / 250 words. A "Submit feedback" button is at the bottom right.

INSTRUCTIONS
Answer honestly — your name is never stored with your answers.

🔒 Your answers are anonymous
You are signed in as rae.hall@gmail.com so the app can check you off and stop a second submission. That record is kept in a separate list from your answers — nothing links what you write to who you are.

AS200 Leadership Lab — Drill Block 3

Instruction was clear and well paced *

Detrimental Alarming Unfavorable Minor Neutral Slight Favorable Major Outstanding

The event was well organised *

Detrimental Alarming Unfavorable Minor Neutral Slight Favorable Major Outstanding

I can apply what I learned *

Detrimental Alarming Unfavorable Minor Neutral Slight Favorable Major Outstanding

What should change next time?

0 / 250 words

Submit feedback

9ThirtyOne — your detachment's data stays in your own Google account.

Nine ratings, every one named

Detrimental, Alarming, Unfavorable, Minor, Neutral, Slight, Favorable, Major, Outstanding.

No numbers on screen

A visible number invites people to average it in their head while answering.

Written answers capped at 250 words

With a live counter as they type.

Built for the walk out of the classroom

Installs to the home screen

Opens like an ordinary app. No address for anyone to remember.

Works with no signal

A submission made offline is saved on the device, shown as pending, and sent automatically when the connection returns.

Nothing is lost to a dropped connection

Two things to do, both one click away

The same screen, pointed at the locked folders

Cadre feedback instructors cannot see — and the commander's own space inside it.

A standardized form, in about two minutes

The screenshot shows the 'Create feedback' form in the 30dayOne application. The form is titled 'Create feedback' and includes a 'Feedback ID' field. It is divided into several sections: 'Start from' (with a dropdown for 'Start from existing set of questions'), 'What the feedback is about' (with fields for 'Class / event name', 'Who is this feedback about?', 'All level', 'Subject year', 'Semester', 'Open', and 'Due'), 'Who receives it' (with radio buttons for 'Everyone at this AS level', 'Individual cadets', and 'Everyone on the roster'), and 'Questions' (with a 'Rating' dropdown and a 'Written answer' checkbox). The form also includes a 'Save as template' button and a 'Preview' button.

Name the class or event

Set the AS level, term and dates

Scheduled forms stay hidden until they open.

Choose who receives it

Everyone at that level, or named cadets.

Add questions — three minimum

A rating or a written answer. No maximum.

Every form gets an ID

Such as FB-2026-0001, to quote in conversation.

Everything an average on its own would hide

Mean, median, range and spread

The distribution across every rating

Shape you can see rather than infer.

An agreement score from 0 to 1

Did they actually agree, or just average out?

Outliers, found robustly

Measured against the median, so one extreme rating cannot hide itself.

**An average of 5 can mean everyone shrugged —
or that half the flight thought it outstanding
and half thought it harmful.**

Same number. Opposite situations. Only one of them needs acting on.

9ThirtyOne finds the split, says so plainly, and tells you the average describes nobody — so you read both groups instead of the middle.

Read the ones that matter first

Sentiment, ranked most negative first

Handles negation and emphasis, so 'not helpful' and 'extremely helpful' both score correctly.

Every answer is shown

Answers the word list cannot read are labelled, never hidden.

It runs on the device

No cloud service sees your cadets' words. That is why it is a word list and not a model, and the accuracy limits are stated on screen.

Word cloud sized by how many people used a word, not how often it appears.

Nothing important sits unread

Safety screen

⚠️ 1 answer flagged for review

These contain language matching the safety and security word lists. A match is a prompt to read the response, not a finding — the list cannot tell "we discussed hazing prevention" from "I was hazed". Read each one and follow your detachment's reporting procedures.

Hazing and abuse of authority

Conduct that degrades or endangers a cadet, or misuse of position.

⚠️ Critical

WHAT SHOULD CHANGE NEXT TIME? hazed made us do

A senior cadet hazed the new flight members and made us do push ups until we cried.

Aug 29, 2026 · AS200 Leadership Lab — Drill Block 3

The word lists live in `js/analysis/lexicon.js` and are meant to be edited — add the terms your detachment actually uses.

Every written answer is screened

Hazing, sexual harassment, discrimination, violence, self-harm, substances, integrity.

Matches are highlighted in context

A prompt, never a finding

It cannot tell 'we discussed hazing prevention' from 'I was hazed'. A person reads it and decides.

16

Anonymous, and still able to chase people

How it works

The cadet signs in, so the app knows who they are. It writes a receipt in a separate folder, then drops the name. The response itself carries no identity.

What that buys

You can say 'two cadets still owe feedback' about responses nobody can attribute — and nobody can submit twice.

The honest limit

With very few responses a single answer can be identified by elimination. So anonymous results stay hidden until three people have responded.

Safety flags are the deliberate exception: a disclosure cannot wait for a third response, so the app tells you one exists and warns that opening it may identify the author.

A roster, not a password list

Everyone signs in with the Google account you already mail them at. Add people by email, one at a time or a whole class by CSV.

One link. Or point a room at a screen.

Cadets do not install anything, configure anything, or type anything.

Send a join link

Chat, email, however you already reach them. It carries the whole setup.

Or show the QR code

On a projector at the start of a meeting. Thirty phones in a minute.

They sign in with Google

The account you already mail them at. That is the whole enrolment.

How is this instructor doing?

The same feedback, grouped by the person it reflects on.

ready

Create Feedback

Build a standardized form, choose the class or event, and issue it to cadets.

Feedback Response and Analysis

Filter by date, class, AS level or feedback ID. See scores, comments and who still owes feedback.

Feedback requests

Responses & analysis

By instructor

Cadets

Database

By instructor

Feedback grouped by the person it reflects on. Nothing here is a ranking — response counts and cohorts differ, and an average of nine ordinal points is not a performance score.

School year

Semester

All years

All semesters

Person	Requests	Responses	Average	
Lindqvist, Ana Instructor	1	2	Withheld — under 3	>
Okafor, Sam Cadre	1	7	Minor : 4.4	>
Reyes, Maria Database admin, Instructor	2	10	Major : 7.9	>
Not attributed				

Your detachment owns its data. Nobody else can reach it.

It lives in your Google Drive, in your account

No vendor database, no copy anywhere else. Delete the folder and it is gone.

Only the folder's owner needs access to it

Cadets and cadre reach their feedback through your own server, not the folder.

Removing somebody removes them permanently

Their feedback stays; their name is stripped out of it and does not come back.

There is an export built for safe backups

No roster, no names, timestamps rounded to the month. Nobody ever asks you for it.

Getting started

1

Create the account

A new Google account for the detachment, and a folder named 9ThirtyOne.

2

Register the app

One free Google Cloud project, so the app can reach that Drive. About ten minutes.

3

Deploy the server

A short script in the same account. Fifteen minutes, and nobody else needs the folder.

4

Send the link

Add people by email, then send one join link. Cadets configure nothing.

Step by step, with screenshots: [9ThirtyOne Setup Guide \(PDF\)](#).
